                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                     á
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences, (I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for cromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used Ci in diagnostics as expressed sequence tags for identifying expressed conditions, (I) is useful in gene therapy techniques to restore normal C constituty of (II) or to treat disease states involving (II). (II) is C useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CC of sites expressing (II). (I) and (II) are useful for treating disorders involving abserrant protein expression or biological activity. The CC polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in CC electronic format directly from Wipo at the control of the 
                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system discorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Nucleic acids encoding polypeptides with cytokine-like in diagnosis and gene therapy. activities, useful

Claim 20; Page 416; 6221pp; English.

The invention relates to polynucleotides (AAKS1456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, interest to cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NC 2110 (AAKS2581), 2111 (AAKS2582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

                                                                                                               Sequence 314 AA;
                                                                                                                                                                                                                                                                                                                                                Hepatic parenchymal cell growth promoter peptide - is isolated from human or animal liver cell or produced by recombinant techniques and used for therapy of liver diseases.
                                                                                                                                                           AAQ77818 encodes AAR65759 rat hepatic parenchymal cell growth factor (HPGF). The protein or the N-terminal peptide (AAR65758) may be used in the diagnosis and treatment of liver diseases, such as liver cancer and cirrhosis. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-MAR-2003
17-MAY-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel SMG-1 (phosphatidyl-inositol kinase-associated kinase) polypeptide and encoding polynucleotide. The SMG-1 protein and polynucleotide are useful in diagnosis of, and screening for drugs for, pathological conditions caused by formation of an early transcription termination codon due to a nonsense mutation, e.g. small-cell lung cancer. The present sequence represents a human SMG-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (TAIS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-SEP-1994

                                                                                                                                                                                                                                                                                                                    The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                   cc sequences. (I) is useful as hybridisation probes, polymerase chain and in recombinant production of (II). The polymucleotides are also used ci n diagnostics as expressed sequence tags for identifying expressed cc antivity of (II) or to treat disease states involving (II) (II) is useful in gene therapy techniques to restore normal cc activity of (II) or to treat disease states involving (II) (II) is compared to treat disease states involving (II) (II) is compared to the supplement. (II) and its binding partners are useful in medical imaging co fistes expressing (II). (I) and (II) are useful in medical imaging co fistes expressing (II). (II) are useful in treating aborders involving aberrant protein expression or biological activity. The colypeptide and polynucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cc amino acid sequences of the invention. Note: The sequence data for this capture of the invention. Note: The sequence data for this content of int/nih/nihilished not sequences.

(I) is useful as hybridisation probes, polymerase chain CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed CC genes. (I) is useful in gene therapy techniques to restore normal CC activity of (II) or to treat disease states involving (II). (II) is CC useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC polypeptide in tissue, as molecular weight markers and as a food complement. (II) and its binding partners are useful in medical imaging CC of sites expressing (II). (I) and (II) are useful for treating disorders complements are protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity and composition of their types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of data and products dependent on DNA and composition of the types of the

ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31-MAR-2000; 2000US-00540217

                                                                                                                                                                                                                    Search completed: October 5, 2004, 07:59:56 Job time : 13.1296 secs
                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) C sequences. (I) is useful as hybridisation probes, polymerase chain C reaction (PCR) primers, oligomers, and for chromosome and gene mapping, CC and in recombinant production of (II). The polynucleotides are also used C genes. (I) is useful in gene therapy techniques to rescore mormal CC useful for generating antibodies against it, detecting or quantitating a CC useful for generating antibodies against it, detecting or quantitating a CC polypeptide in tissue, as molecular weight markers and as a food CC supplement. (II) and its binding partners are useful in medical imaging CI involving aberrant protein expression or biological activity. The CC involving aberrant protein expression or biological activity. The CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in CC electronic format directly from WIPO at CC fip.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HOL. Chem. 270:16230-16235 (1995).
FUNCTION: INVOLVED IN THE FORMATION OF IRON-SULFUR COMPLEXES, FUNCTION: INVOLVED IN THE FORMATION OF SULFUR-CONTAINING CYANIDE DETOXIFICATION OR MODIFICATION OF SULFUR-CONTAINING ENZYMES. OTHER THIOL COMPOUNDS, BESIDES CYANIDE, CAN ACT AS SULFUR-CEPTORS. ALSO HAS WEAK MERCAPTOPYRUVATE SULFURTRANSFERASE ION ACCEPTORS. ALSO HAS WEAK MERCAPTOPYRUVATE SULFURTRANSFERASE
                                                                                                                                                                                                                                                                                                                                                                                                          S15081; S15081.

This SWISS-PROT entry is copyright. It is produced between the Swiss Institute of Bioinformatics and the European Bioinformatics Institute. There are

Trevino R.J., Hunt J., Horowitz P.M., Chirgwin J.M.; Chinese hamster rhodanese cDNA: activity of the expressed protein blocked by a C-terminal extension."

Protein Expr. Purif. 6:693-699(1995).

-I-- FUNCTION: FORMATION OF IRON-SULFUR COMPLEXES AND CYANIDE

K.

DETOXIFICATION. BINDS MOLECULAR OXYGEN AND SULFUR.
CATALYTIC ACTIVITY: Thiosulfate + cyanide = sulfite + thiocyanate.
SUBUNIT: Monomer (By similarity).
SUBCELLULAR LOCATION: Mitochondrial matrix.
DOMAIN: THE STRUCTURE CONSISTS OF 2 DOMAINS OF VERY SIMILAR CONFORMATION, SUGGESTING A COMMON EVOLUTIONARY ORIGIN. HOWEVER,
THE SEQUENCES OF THE 2 DOMAINS ARE VERY DIFFERENT.
SIMILARITY: Contains 2 rhodanese domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACTIVITY (BY SIMILARITY).

CATALYTIC ACTIVITY: Thiosulfate + cyanide = sulfite + thiocyanate.

SUBUNIT: Monomer:

SUBCELLULAR LOCATION: Mitochondrial matrix.

SUBCALIVITY: THE STRUCTURE CONSISTS OF 2 DOMAINS OF VERY SIMILAR

CONFORMATION, SUGGESTING A COMMON EVOLUTIONARY ORIGIN. HOWEVER,

THE SEQUENCES OF THE 2 DOMAINS ARE VERY DIFFERENT.

SIMILARITY: Contains 2 rhodanese domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Biotechnol 21:566-569(2003).

FUNCTION: FORMATION OF IRON-SULFUR COMPLEXES, CYANIDE PUNCTION: FORMATION OF IRON-SULFUR CONTAINING ENZYMES.

DETOXIFICATION OR MODIFICATION OF SULFUR-CONTAINING ENZYMES.

OTHER THIOL COMPOUNDS, BESIDES CYANIDE, CAN ACT AS SULFUR ION ACCEPTORS. ALSO HAS WEAK MERCAPTOPYRUVATE SULFURTRANSFERASE (MST)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180370;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: In mouse, there are two classes of high-affinity IL3 receptors. One contains this IL3-specific beta chain and the ot contains the beta chain also shared by high-affinity IL5 and GN CSF receptors.
SUBCUNIT: Heterodimer of an alpha and a beta chain.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY A Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Subfamily 4.

Inactive (GlcNAc)2 and (GlcNAc)3. Inactive (CMCNAc)2 and (GlcNAc)5. To (GlcNAc)2 and (GlcNAc)3. Inactive towards chitin, glucosamine oligosaccharides, glycoproteins are glycopeptides containing (GlcNAc)2. Has optimum activity at plants of S-7.0 and at a temperature of 35-37 degrees Celsius.

-i- CATALYTIC ACTIVITY: Hydrolysis of the 1,4-beta-linkages of N-acetyl-D-glucosamine polymers of chitin.
                                                                                                                                                                                                           CHAIN

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

                 The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human baings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #22 from lama (camelid) species
                                                                                                                                                                          New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid
                                                                                                                                          Example 2;
                                                                                                                                                                 of light chains.

                                                                                                                                                                                                                               The invention relates to a non-naturally occurring peptide of CC Mycobacterium tuberculosis comprising an amino acid sequence corresponding to an anion pump protein. The invention also relates to a corresponding to an anion pump protein. The invention also relates to a corresponding to a DNA sequence of Mycobacterium tuberculosis or Mycobacterium teprae. The new peptide is cuseful as a vaccine against Mycobacterium tuberculosis or Mycobacterium cleprae or for screening for new tuberculosis drugs. Purified proteins concluded from the sequences of the invention may elicit a specific immune concepts. The peptide may also be used to detect hypersensitivity creactions of individuals exposed to Mycobacterium tuberculosis or Mycobacterium leprae. The proteins and peptides may be affixed to solid supports to detect antibodies typical of hypersensitivity reactions, from a patient's sera. This sequence represents Mycobacterium leprae non-naturally occurring peptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was cobacterium electronic format directly from USPTO at
